Feature Name

Run Query (Action Execution)

What We Believe It Does

> The project Appsmith is a platform helps teams to quickly build internal tools. It can be used to build UI and connect to database and run queries.

This feature is in Queries. When we hit the **“run”** button, it will read the information we gave, like **URL, Method (GET or POST)**. It will send the queries to database or external API, and get data or error message.

Why We Chose This Feature

Because we can’t look at the code, so we just run the program and see its function.

And we think this feature is not too simple or too complex, it can be easier to draw some models.

And this feature is easy to observe or test in the front end.

Notes

- Used codex to install the dependencies
- Used ChatGPT to make the format look better
