SWE 265P: Part2

Part 2：How Do You Think It Works

Project Selected

Appsmith

Name

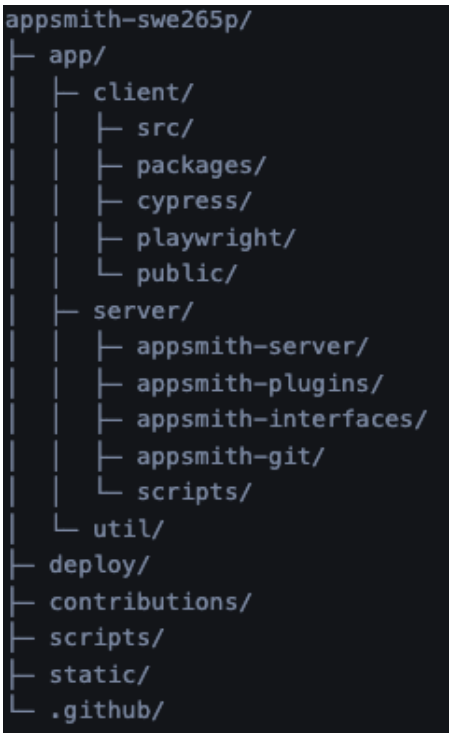

- Ping Lu

Feature Name

Run Query (Action Execution)

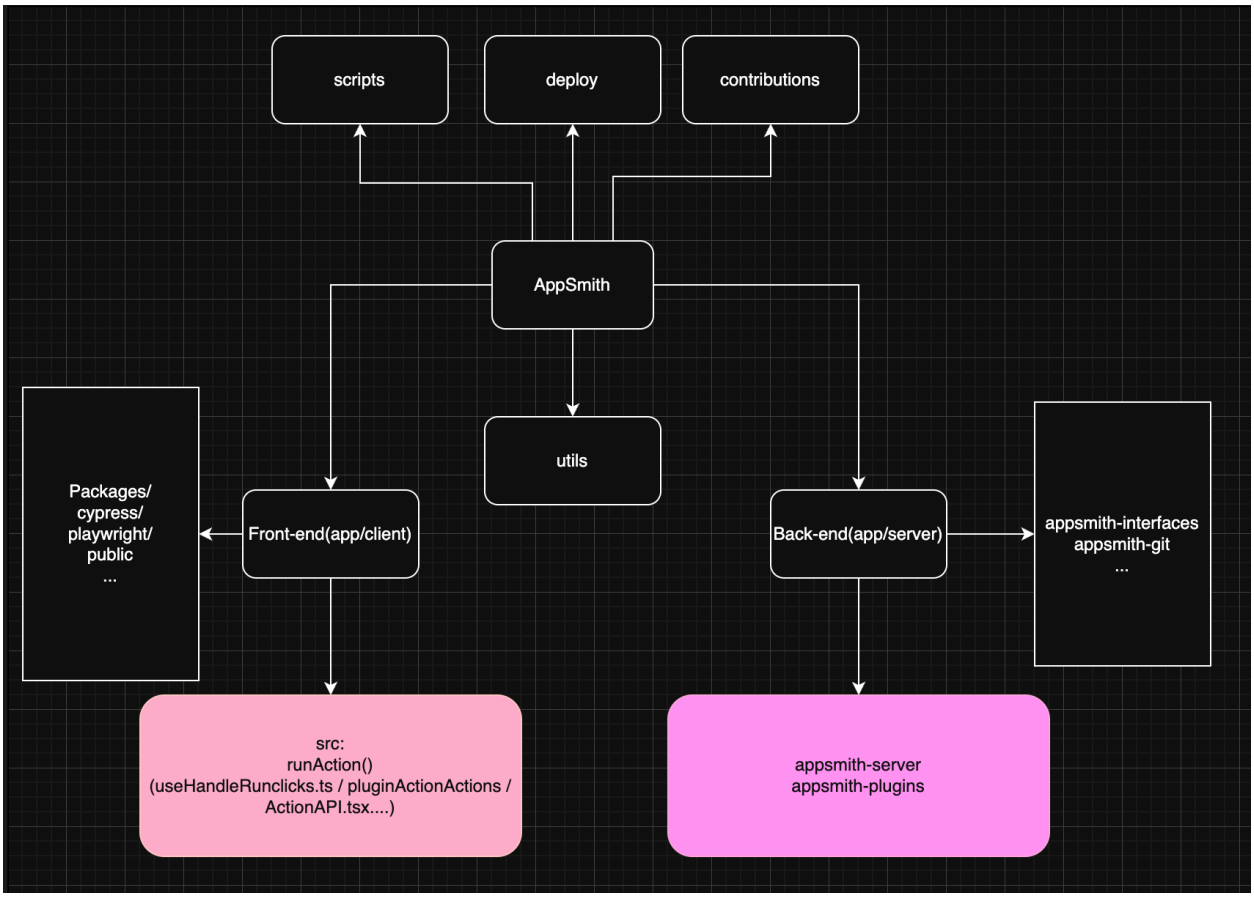

1. Draw a model of where the feature your team chose is located

At first, I asked ChatGPT to generate the file structure for me:

Then I asked Codex of what is the name of this feature. It turns out “runAction” is the answer. Get where using this function by searching the word in code by myself.

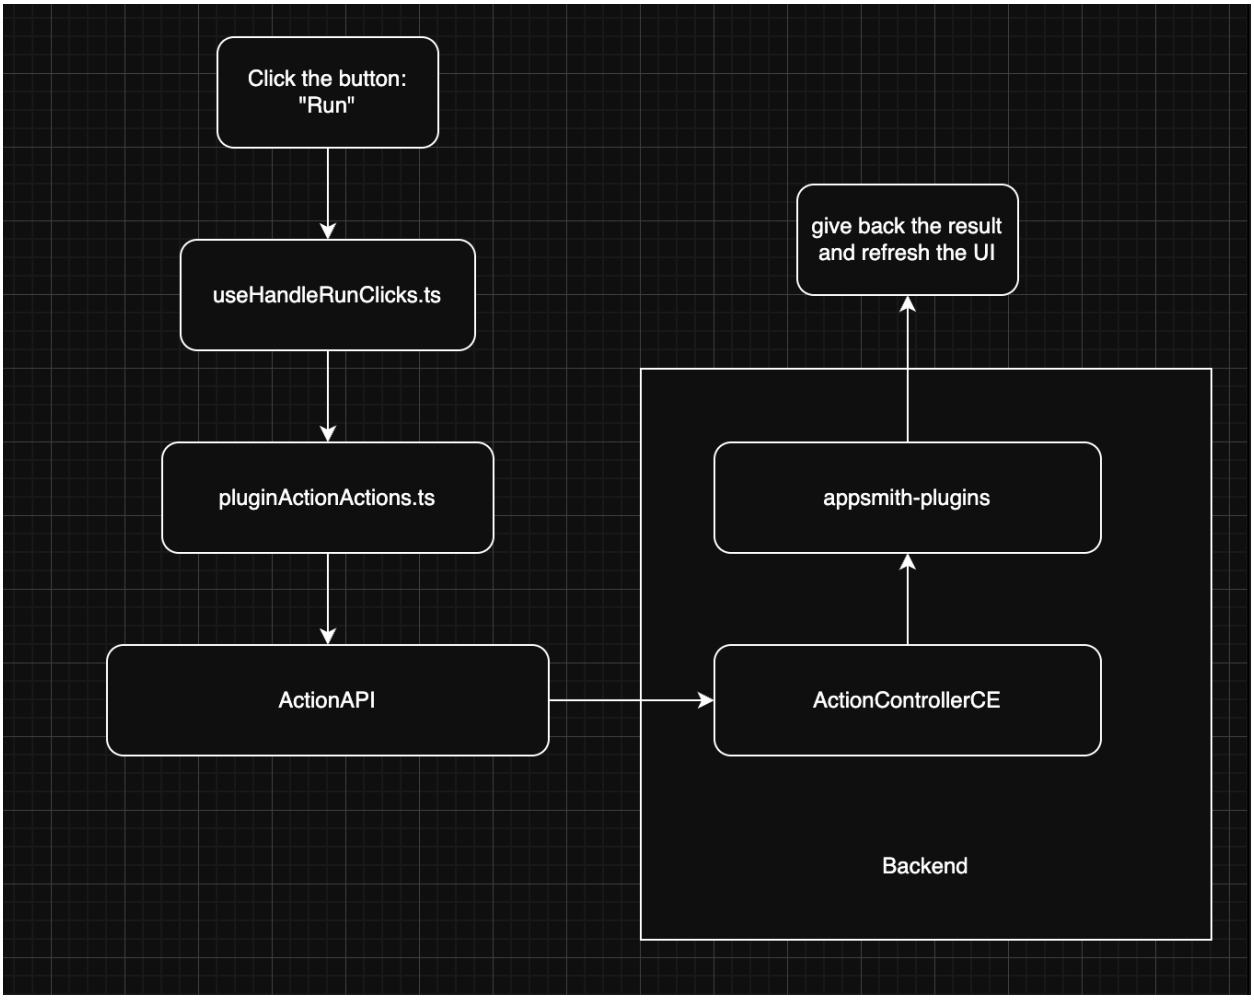

Picture of location for **Run Query (Action Execution):**

Draw by my self using diagrams.net (draw.io)

(Used Codex to get which files of backend are related to run query feature)

2. Draw a model of how that feature works

Used Codex to find out the data flow between pluginActionActions and appsmith-plugin. Also let it verify this process. It turns out Saga is also part of the process.
